

**6 CHAPTER REVIEW**

**Key Concept Review**

- What is the opposite of a decomposition chemical reaction?
- The prefix “syn-” means “together.” Explain why this is a suitable prefix for describing a synthesis chemical reaction.
- What are the two types of displacement chemical reactions?
- What is the general formula for a hydrocarbon compound?
- What are some fossil fuels formed?
- Name the six different types of chemical reactions discussed in chapter 6.
- In which two types of chemical reactions is water always produced?
- Which type of chemical reaction is described by each of the following general chemical equations?
  - $AB + C \rightarrow AC + B$
  - $AB + CD \rightarrow AD + CB$

**Connect Your Understanding**

- Suggest two or more reasons why it is important for chemists to study many examples of the different types of chemical reactions you learned about in this chapter.
- Name the product in each of the following reactions.
  - potassium and iodine
  - nitrogen and chlorine
- What two compounds are always produced by the combustion of hydrocarbons and carbohydrates?

**10. word equation:**  $\text{hydrocarbon} + \text{oxygen} \rightarrow \text{carbon dioxide} + \text{water}$   
**11. word equation:**  $\text{hydrocarbon} + \text{oxygen} \rightarrow \text{carbon dioxide} + \text{water}$   
**12. word equation:**  $\text{hydrocarbon} + \text{oxygen} \rightarrow \text{carbon dioxide} + \text{water}$   
**13. word equation:**  $\text{hydrocarbon} + \text{oxygen} \rightarrow \text{carbon dioxide} + \text{water}$

## Key Concept Review

- The opposite of a decomposition chemical reaction is a synthesis chemical reaction.
- “Syn-” means together. It is a suitable prefix for describing a synthesis chemical reaction because in this type of reaction, two single elements (either two metals or two non-metals) combine (“get together”) to form a compound.
- The two types of displacement chemical reactions are single displacement reactions and double displacement reactions.
- The general formula for a hydrocarbon compound is  $C_xH_y$ .
- Fossil fuels are hydrocarbons formed from the remains of once-living organisms.
- The six different types of chemical reactions are: synthesis, decomposition, combustion, single displacement, double displacement, and neutralization.
- Water is always produced in combustion reactions and in neutralization reactions.
- (a) double displacement reaction  
(b) neutralization reaction

## Connect Your Understanding

- Scientists need to study many examples of chemical reactions because there are so many different elements on Earth and so many different compounds. Each set of reactions is unique and can have important and often surprising applications.
- (a) potassium and iodine  $\rightarrow$  potassium iodide  
(b) cesium and chlorine  $\rightarrow$  cesium chloride
- Carbon dioxide gas ( $CO_2$ ) and water ( $H_2O$ ) are always produced by the combustion of hydrocarbons and carbohydrates.
- word equation: magnesium chloride  $\rightarrow$  magnesium + chlorine  
skeleton equation:  $MgCl_2(s) \rightarrow Mg(s) + Cl_2(g)$   
balanced chemical equation:  $MgCl_2(s) \rightarrow Mg(s) + Cl_2(g)$
- When combustion reactions release carbon dioxide gas into the atmosphere, they contribute to global warming. Atmospheric carbon dioxide gas prevents thermal energy from escaping into space. As the levels of carbon dioxide gas have increased over the past century, the average temperature on Earth has also increased. This global warming will have large environmental, social, and economic effects.

14. (a) synthesis  
 (b) decomposition  
 (c) single displacement  
 (d) double displacement  
 (e) combustion  
 (f) double displacement  
 (g) decomposition
15. This is a double displacement reaction. The balanced chemical equation is:  $\text{FeCl}_2(\text{aq}) + \text{K}_2\text{S}(\text{aq}) \rightarrow \text{FeS}(\text{s}) + 2\text{KCl}(\text{aq})$ .
16. You would be able to see the iron(II) sulphide, FeS, in the bottom of the container. You know this because the equation indicates that FeS is a solid.
17. (a) decomposition:  $\text{CaCl}_2(\text{g}) \rightarrow \text{Ca}(\text{s}) + \text{Cl}_2(\text{g})$   
 (b) decomposition:  $2\text{NaN}_3(\text{s}) \rightarrow 2\text{Na}(\text{s}) + 3\text{N}_2(\text{g})$   
 (c) double displacement:  $\text{Pb}(\text{NO}_3)_2(\text{aq}) + \text{Cu}_2\text{SO}_4(\text{aq}) \rightarrow \text{PbSO}_4(\text{s}) + 2\text{CuNO}_3(\text{aq})$   
 (d) decomposition:  $2\text{Ni}_2\text{O}_3(\text{s}) \rightarrow 4\text{Ni}(\text{s}) + 3\text{O}_2(\text{g})$   
 (e) combustion:  $\text{CH}_4(\text{g}) + 2\text{O}_2(\text{g}) \rightarrow \text{CO}_2(\text{g}) + 2\text{H}_2\text{O}(\text{g})$   
 (f) double displacement:  $3\text{NaI}(\text{aq}) + \text{AlCl}_3(\text{aq}) \rightarrow 3\text{NaCl}(\text{aq}) + \text{AlI}_3(\text{s})$
18. (a) double displacement:  $\text{Na}_2\text{SO}_4 + \text{CaCl}_2 \rightarrow 2\text{NaCl} + \text{CaSO}_4$   
 (b) synthesis:  $3\text{Mg} + 2\text{N}_2 \rightarrow \text{Mg}_3\text{N}_2$   
 (c) double displacement:  $\text{Sr}(\text{OH})_2 + \text{PbBr}_2 \rightarrow \text{SrBr}_2 + \text{Pb}(\text{OH})_2$   
 (d) synthesis:  $4\text{Na} + \text{O}_2 \rightarrow 2\text{Na}_2\text{O}$   
 (e) synthesis:  $\text{N}_2 + 3\text{H}_2 \rightarrow 2\text{NH}_3$   
 (f) decomposition:  $2\text{HCl} \rightarrow \text{H}_2 + \text{Cl}_2$   
 (g) single displacement:  $2\text{AlI}_3 + 3\text{Br}_2 \rightarrow 2\text{AlBr}_3 + 3\text{I}_2$   
 (h) neutralization:  $\text{HCl} + \text{NaOH} \rightarrow \text{NaCl} + \text{H}_2\text{O}$
19. This is a synthesis reaction:  $\text{Ca} + \text{I}_2 \rightarrow \text{CaI}_2$ .
20. This is a single displacement reaction:  $\text{Zn}(\text{s}) + \text{CuSO}_4(\text{aq}) \rightarrow \text{Cu}(\text{s}) + \text{ZnSO}_4(\text{aq})$ .
21.  $\text{Mg}(\text{s}) + \text{Br}_2(\text{g}) \rightarrow \text{MgBr}_2(\text{s})$
22. This is a double displacement reaction.  
 Word equation: zinc bromide + silver nitrate  $\rightarrow$  silver bromide + zinc nitrate  
 Skeleton equation:  $\text{ZnBr}_2(\text{aq}) + \text{AgNO}_3(\text{aq}) \rightarrow \text{AgBr}(\text{s}) + \text{Zn}(\text{NO}_3)_2(\text{aq})$   
 Balanced equation:  $\text{ZnBr}_2(\text{aq}) + 2\text{AgNO}_3(\text{aq}) \rightarrow 2\text{AgBr}(\text{s}) + \text{Zn}(\text{NO}_3)_2(\text{aq})$
23. Yes, she is correct. The reactants for a neutralization reaction are always an acid and a base, both of which are compounds.

## Reflection

24. Student answers may vary but might include combustion reactions because they produce energy, or neutralization reactions because they prevent acid indigestion and assist in neutralizing hydrochloric acid as it enters the small intestine during digestion and also because they reduce environmental damage due to acid precipitation. You might ask students to prepare a small poster to advertise the benefits of the chemical reaction they have chosen as an extension mini-project.

### After Writing

Student answers will vary but may include the following. Scientific writing includes relevant section titles, tables of data, key terms (sometimes in bold), definitions of key terms, examples, figures that illustrate concepts, sample questions, and practice problems. Students may indicate that science writing differs from writing in other courses because it more factual and can include mathematical information, formulas, and subject-specific vocabulary. Science writing can sometimes include diagrams, which are less common in writings in other courses.

### Unit Task Link
