

## Water

All acids and bases are aqueous (dissolved in water)

Water can self ionize to form ions

The amount of  $\text{H}^+$  ions = the amount of  $\text{OH}^-$  ions, therefore we call the solution neutral

The amount of  $\text{H}^+$  ions =  **$1 \times 10^{-7}$**  units

The pH of the solution = 7

The pH is actually the exponent of the scientific notation

All acids and bases will have a small amount of  $\text{OH}^-$  or  $\text{H}^+$  ions

Acids produce  $\text{H}^+$  ions but a small amount of  $\text{OH}^-$  ions will be present

Bases produce  $\text{OH}^-$  ions but a small amount of  $\text{H}^+$  ions will be present

## pH scale

- The pH scale measures the amount of  $H^+$  ions in the solution
- When  $H^+ > OH^-$  then we will have an acid
- When  $OH^- > H^+$  then we will have a base
  
- The pH scale ranges from 0 - 14 and measures how acidic or basic the chemical is.
  
  
- Water has a pH of 7
- Water is halfway between an acid and a base
- A strong acid has a pH of 0, A weak acid has a pH of 6
- A strong base has a pH of 14, A weak base has a pH of 8
- For every one step decrease in pH there is a 10 times increase in the acidity of the solution
- A pH of 5 is 10 times more acidic than a pH of 6
- pH of 4 is 100 times more acidic than a pH of 6
  
- When an acid combines with a base they neutralize each other
  - The acid increases its pH
  - The base decreases in pH
  - After the reaction the pH is 7
  
- Acids and bases react to form water

Neutralization reactions look very much like double displacement reactions

## Water

All acids and bases are aqueous (dissolved in water)

Water can self ionize to form ions

The amount of  $\text{H}^+$  ions = the amount of  $\text{OH}^-$  ions, therefore we call the solution neutral

The amount of  $\text{H}^+$  ions = \_\_\_\_\_ units

The pH of the solution = \_\_\_\_\_

The pH is actually the \_\_\_\_\_ of the scientific notation

All acids and bases will have a small amount of  $\text{OH}^-$  or  $\text{H}^+$  ions

Acids produce \_\_\_\_\_ but a small amount of \_\_\_\_\_ will be present

Bases produce \_\_\_\_\_ but a small amount of \_\_\_\_\_ will be present

## pH scale

- The pH scale measures the amount of \_\_\_\_\_ in the solution
  - When \_\_\_\_\_ then we will have an acid
  - When \_\_\_\_\_ then we will have a base
  - The pH scale ranges from 0 - 14 and measures how acidic or basic the chemical is.
-
