# **Naming Compounds Handout**

#### IONIC COMPOUNDS versus MOLECULAR COMPOUNDS

ionic compound: consist of cations (positive ions) and anions (negative ions)

held together by electrostatic attraction

– usually metal + nonmetal(s)

- made of monatomic ions, polyatomic ions, and/or both

monatomic ions: consist of a single atom

polvatomic ions: consist of more than one atom

molecular compound: consist of **nonmetal atoms** bonded together by

shared electrons (covalent bonding)

acid: a molecular compound that releases

hydrogen ions (H<sup>+</sup>) when dissolved in water

#### NAMING MONATOMIC CATIONS:

Metal atoms lose valence electrons to form positively charged ions, called **cations**.

An ion formed from an individual atom is a **monatomic** (or monoatomic) **cation**.

I. Groups IA, IIA, IIIA elements silver (Ag), and zinc (Zn) form only one type of ion:

Group IA elements form +1 ions: H<sup>+</sup>, Li<sup>+</sup>, Na<sup>+</sup>, K<sup>+</sup>
 Group IIA elements form +2 ions: Be<sup>+2</sup>, Mg<sup>+2</sup>, Ca<sup>+2</sup>, Sr<sup>+2</sup>, Ba<sup>+2</sup>
 Group IIIA elements form +3 ions: Al<sup>+3</sup>

- silver ion =  $Aq^{+}$ ; zinc ion =  $Zn^{+2}$ 

When a Group IA, IIA, IIIA element, silver, or zinc forms an ion, it is named:

element name + ion

e.g.  $Na^+ = sodium ion$ 

 $Sr^{+2}$  = strontium ion

 $7n^{+2}$  = zinc ion

- II. The Stock system is used to name transition metals and other metals that form more than one ion:
  - $-\,$  iron (Fe) forms two ions:  $\,{\rm Fe}^{+2}$  and  ${\rm Fe}^{+3}$
  - lead (Pb) forms two ions: Pb<sup>+2</sup> and Pb<sup>+4</sup>

When a metal can form more than one ion, each ion is named:

# element name (charge in Roman numerals) + ion

e.g. 
$$Fe^{+2} = iron (II) ion$$
  $Pb^{+2} = lead (II) ion$   $Cu^{+} = copper (I) ion$   $Fe^{+3} = iron (III) ion$   $Pb^{+4} = lead (IV) ion$   $Cu^{+2} = copper (II) ion$ 

$$Pb^{+2} = lead (II) ion$$

$$Cu^{\dagger} = \text{copper (I) ion}$$
  
 $Cu^{+2} = \text{copper (II) ion}$ 

Name each of the following monatomic cations:

$$Mg^{+2} = \underline{\hspace{1cm}}$$

$$Mn^{+2} =$$

$$Co^{+3} =$$

## NAMING MONATOMIC ANIONS:

Nonmetal atoms gain valence electrons to form *negatively charged ions* called anions.

When a nonmetal forms an ion, it is named:

e.g. 
$$O = \mathbf{ox}$$
ygen atom  $\Rightarrow O^{-2} = \mathbf{ox}$ ide ion

$$N = nitrogen$$
 atom  $\Rightarrow$   $N^{-3} = nitride$  ion

Name each of the following monatomic anions:

$$\Gamma = P^{-3} =$$

## NAMING POLYATOMIC IONS:

lons made up of more than one atom are polyatomic ions:

- only one polyatomic cation: NH<sub>4</sub><sup>+</sup> = ammonium ion
- many polyatomic anions: see table below

$$OH^-$$
 = hydroxide ion  $NO_2^-$  = nitrite ion  $C_2H_3O_2^-$  = acetate ion

$$CN^{-}$$
 = cyanide ion  $NO_{3}^{-}$  = nitrate ion  $PO_{4}^{-3}$  = phosphate ion  $SO_{4}^{-2}$  = sulfate ion  $MnO_{4}^{-}$  = permanganate ion

$$CrO_4^{-2}$$
 = chromate ion  $SO_4^{-2}$  = sulfate ion  $MnO_4^{-}$  = permanganate ion

$$Cr_2O_7^{-2}$$
 = dichromate ion  $SO_3^{-2}$  = sulfite ion  $CO_3^{-2}$  = carbonate ion

HCO<sub>3</sub> = hydrogen carbonate ion or bicarbonate ion

Name each of the following polyatomic ions:

$$CrO_4^{-2} =$$
\_\_\_\_\_\_

$$SO_4^{-2} =$$
\_\_\_\_\_\_N $O_3^{-} =$ \_\_\_\_\_

$$OH^- =$$
\_\_\_\_\_\_  $PO_4^{-3} =$ \_\_\_\_\_\_

$$NH_4^+ =$$
\_\_\_\_\_\_  $C_2H_3O_2^- =$ \_\_\_\_\_\_

$$C_2H_3O_2^- =$$
\_\_\_\_\_\_

## WRITING CHEMICAL FORMULAS GIVEN INDIVIDUAL IONS

Compounds must be neutral ⇒ total +ve charge = total -ve charge

1. If the two ions have exactly opposite charges (+1 and -1, +2 and -2, +3 and -3) ⇒ formula of the compound contains one of each ion

e.g. 
$$Na^{+} + Cl^{-} \Rightarrow NaCl$$

$$Na^{+} + Cl^{-} \Rightarrow NaCl \qquad K^{+} + NO_{3}^{-} \Rightarrow KNO_{3}$$

$$Ca^{+2} + S^{-2} \Rightarrow CaS$$

$$Ca^{+2} + S^{-2} \Rightarrow CaS$$
  $Ba^{+2} + SO_4^{-2} \Rightarrow BaSO_4$ 

$$AI^{+3} + N^{-3} \implies AIN$$

$$AI^{+3} + N^{-3} \Rightarrow AIN$$
  $Fe^{+3} + PO_4^{-3} \Rightarrow FePO_4$ 

Combine each pair of ions to get the formula of the compound they form:

$$NH_4^+ + F^- \Rightarrow \underline{\hspace{1cm}}$$

$$Li^{+} + CN^{-} \Rightarrow \underline{\hspace{1cm}}$$

$$Sr^{+2} + CO_3^{-2} \Rightarrow \underline{\hspace{1cm}}$$

$$AI^{+3} + PO_4^{-3} \Rightarrow$$
\_\_\_\_\_

$$Na^{+} + C_2H_3O_2^{-} \Rightarrow$$
\_\_\_\_\_

$$K^{+} + OH^{-} \Rightarrow \underline{\hspace{1cm}}$$

$$Ni^{+2} + CrO_4^{-2} \Rightarrow$$
\_\_\_\_\_\_

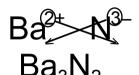

$$Fe^{+3} + N^{-3} \Rightarrow \underline{\hspace{1cm}}$$

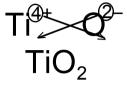

$$Cu^{+2} + SO_4^{-2} \Rightarrow \underline{\hspace{1cm}}$$

$$Co^{+3} + P^{-3} \Rightarrow$$

- 2a. If two monatomic ions have different charges
  - use crossover rule to get formula of the compound
    - superscript for cation becomes subscript for anion
    - superscript for anion becomes subscript for cation
    - simplify subscripts to get lowest ratio of atoms (Note: Only the numbers cross down, not the signs!)

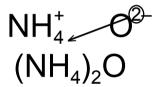

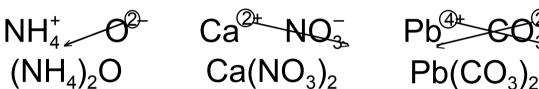

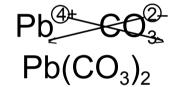

Ti<sub>2</sub>O<sub>4</sub> is simplified!

- b. If two ions have different charges and at least polyatomic ion is involved
  - ⇒ use crossover rule to get formula of the compound
    - if more than one of polyatomic ion in formula, use parentheses
    - simplify subscripts to get lowest ratio of atoms (Note: Again only the numbers cross down, not the signs!)

Pb<sub>2</sub>(CO<sub>3</sub>)<sub>4</sub> is simplified!

Combine each pair of ions to get the formula of the compound they form:

$$Cu^+$$
  $O^{-2}$ 

$$\operatorname{Sn}^{+4} \operatorname{SO_4}^{-2}$$

$$K^+$$
  $P^{-3}$ 

$$Li^+$$
  $CO_3^{-2}$ 

$$Fe^{+3} S^{-2}$$

$$Ni^{+2}$$
  $PO_4^{-3}$ 

#### CHEMICAL FORMULAS AND NAMES FROM INDIVIDUAL IONS

Compounds are named from the individual ions they come from.

Name the cation and the anion, then remove "ion" from each name:

e.g. 
$$Na^{+} =$$
**sodium** ion  $CI^{-} =$ **chloride** ion  $\Rightarrow$  **NaCl = sodium chloride**

$$K^{\dagger}$$
 = potassium ion  $CO_3^{-2}$  = carbonate ion  $\Rightarrow$   $K_2CO_3$  = potassium carbonate

Fe<sup>+3</sup> = iron (III) ion  

$$NO_3^-$$
 = nitrate ion  $\Rightarrow$  Fe(NO<sub>3</sub>)<sub>3</sub> = iron (III) nitrate

$$Ag^{+} = silver$$
 ion  
 $S^{-2} = sulfide$  ion  $\Rightarrow Ag_{2}S = silver$  sulfide

Combine each pair of ions to get the chemical formula, then name the compound:

Individual ions Compound Formula Compound Name  $Mg^{+2} \quad F^{-} \qquad \underline{MgF_2} \qquad \underline{magnesium \ fluoride}$   $Ni^{+2} \quad S^{-2} \qquad \underline{\qquad \qquad }$   $Ca^{+2} \quad Br^{-} \qquad \underline{\qquad \qquad }$   $Al^{+3} \quad P^{-3} \qquad \underline{\qquad \qquad }$   $Co^{+2} \quad NO_2^{-} \qquad \underline{\qquad \qquad }$   $Fe^{+3} \quad O^{-2}$ 

#### GIVEN THE CHEMICAL FORMULA, NAME THE COMPOUND

- 1. If the metal is in Groups IA–IIIA, silver, cadmium, or zinc, then just name the metal cation and the anion:
  - e.g.  $NaCI \Rightarrow Na = sodium$  and  $CI = chloride \Rightarrow sodium chloride$   $BaI_2 \Rightarrow Ba = barium$  and  $I = iodide \Rightarrow barium iodide$   $AI(OH)_3 \Rightarrow AI = aluminum$  and  $OH = hydroxide \Rightarrow aluminum hydroxide$
  - **ZnSO**<sub>4</sub>  $\Rightarrow$  Zn = zinc and SO<sub>4</sub> = sulfate  $\Rightarrow$  zinc sulfate
- 2. If the metal can form more than one ion.
  - a. Determine the charge on the cation using the charge on the anion.
  - b. Name the cation and the anion, then remove "ion" from both
  - e.g. **NiBr**<sub>2</sub> ⇒ Since the ion formed is Br<sup>-</sup>, then 2 Br's have an overall negative charge of –2. To get an overall charge of zero for the compound, the overall positive charge must be +2. Thus, Ni must have a charge of +2, so the ion nickel forms is Ni<sup>+2</sup>.
    - $\Rightarrow$  Ni<sup>+2</sup> = nickel (II) ion Br = bromide ion  $\Rightarrow$  NiBr<sub>2</sub> = nickel (II) bromide
  - c. If a polyatomic ion is involved, remember that more than one polyatomic is shown in parentheses—i.e. **DO NOT multiply the charge of the polyatomic ion with the subscript of the** *atoms* **in a polyatomic ion.**

**CuSO**<sub>4</sub>  $\Rightarrow$  There is only ONE Cu and ONE SO<sub>4</sub>, so get the charge for the Cu based on the SO<sub>4</sub>. The formula is  $SO_4^{-2}$ , and there is only ONE  $SO_4^{-2}$ , so Cu's charge here must be +2 for the compound to have an overall charge of zero.

$$\Rightarrow$$
 Cu<sup>+2</sup> = copper (II) ion SO<sub>4</sub><sup>-2</sup> = sulfate ion  
then  $\Rightarrow$  CuSO<sub>4</sub> = copper (II) sulfate

Give the name for each compound given its chemical formula:

Formula	Individual lons	Name of Compound
MgCl <sub>2</sub>	Mg <sup>+2</sup> Cl⁻	magnesium chloride
LiOH		
ZnCO <sub>3</sub>		
K <sub>2</sub> S		
FePO <sub>4</sub>		
SnO <sub>2</sub>		
CuBr <sub>2</sub>		
Ag <sub>3</sub> N		
Mn(CN) <sub>2</sub>		
AgC <sub>2</sub> H <sub>3</sub> O <sub>2</sub>		

#### WRITING CHEMICAL FORMULAS GIVEN THE COMPOUND NAME

Get the individual ions from the name, then combine them using the crossover rule:

e.g. barium chloride 
$$\Rightarrow$$
 barium = Ba<sup>+2</sup> chloride = Cl<sup>-</sup>

$$Ba^{+2} Cl^- \Rightarrow BaCl_2$$

aluminum sulfate 
$$\Rightarrow$$
 aluminum = Al<sup>+3</sup> sulfate = SO<sub>4</sub><sup>-2</sup>

$$Al^{+3} SO_4^{-2} \Rightarrow Al_2(SO_4)_3$$

## Give the chemical formula for each compound given its name:

Name of Compound	individual ions	Formula
lithium cyanide	Li <sup>+</sup> CN <sup>-</sup>	LiCN
iron (III) sulfate		
calcium iodide		
tin (IV) dichromate		
silver nitrite		
copper (II) acetate		
zinc carbonate		
lead (II) phosphide		
potassium sulfite		
cobalt (II) nitride		
nickel (II) permanganate		

## NAMING MOLECULAR COMPOUNDS

Indicate number of atoms of each element with **Greek prefix** before element name:

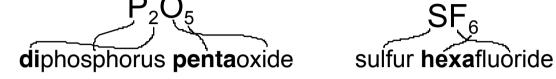

# of atoms	Greek Prefix	# of atoms	Greek Prefix
1	mono (usually omitted)	6	hexa
2	di	7	hepta
3	tri	8	octa
4	tetra	9	nona
5	penta	10	deca

For the **first element**: Greek prefix + element name

For the second element: Greek prefix + element name stem + "-ide"

Mono is generally omitted, except in common names like Note:

CO = carbon monoxide

Name the following molecular compounds:

### **DETERMINING FORMULAS OF MOLECULAR COMPOUNDS**

Use Greek prefix(es) to determine number of atoms of each element in formula.

Get **elements** and **number of atoms** of each from name: tetraphosphorus hexasulfide Give the formulas for each of the following molecular compounds:

nitrogen trichloride dibromine heptaoxide dinitrogen pentasulfide

#### DETERMINING FORMULAS AND NAMES OF ACIDS FROM IONS

Name each of the following ions, and determine the formula and name of the corresponding acid that forms from the ion.

Name of Ion Formula of Acid Name of Acid
$$CO_3^{-2} = \underline{\text{carbonate ion}} \Rightarrow \underline{\text{H}_2CO_3} \quad (aq) = \underline{\text{carbonic acid}} \quad \\
CI^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
SO_3^{-2} = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
PO_4^{-3} = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \Rightarrow \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad \\
NO_3^- = \underline{\qquad} \quad (aq) = \underline{\qquad} \quad (a$$

Name eac	h of the	following	acids:
----------	----------	-----------	--------

$$H_2S (aq) =$$
  $HC_2H_3O_2 (aq) =$   $HC_2H_3O_2 (aq) =$ 

Give the formula for each of the following acids: [Don't forget to indicate (aq)!]

#### **PUTTING IT ALL TOGETHER:**

#### Name each of the following compounds:

$$K_2SO_4$$
 \_\_\_\_\_  $Cr(C_2H_3O_2)_3$ \_\_\_\_\_
