## 4.6 EMPIRICAL AND MOLECULAR FORMULAS

#### **PRACTICE**

(Page 186)

#### **Understanding Concepts**

- 1. Empirical means derived from observation and experimentation.
- 2. A molecular formula gives the number of each kind of atom or ion, as opposed to an empirical formula which gives the simplest numerical ratio of the component atoms and/or ions.
- 3. Different compounds can exist because the same number and kind of atoms are bonded together differently, like ethanol, CH<sub>3</sub>CH<sub>2</sub>OH, and dimethyl ether, CH<sub>3</sub>OCH<sub>3</sub>. These two different compounds have very different properties, but would have the same percentage composition.
- 4. Possible molecular formulas could be  $C_2H_6$ ,  $C_3H_9$ ,  $C_4H_{12}$ , or indeed, any compound with the general formula  $C_nH_{2n}$ , where n is any integer.
- 5. (a) NO<sub>2</sub>
  - (b) CO<sub>2</sub>
  - (c) CH<sub>2</sub>O
  - (d)  $C_3\bar{H}_2Cl$
- 6. Sodium chloride does not exist as molecules, but as a three-dimensional lattice of ions; so there is no such concept as a molecular formula for this, or any other, ionic compound. The same rule applies to network solid elements and compounds the formulas we use are always the simplest ratio of component ions or atoms.

### Try This Activity: Distinguish Between Empirical and Molecular Formulas

### (Page 187)

Name	Empirical Formula	Molecular Formula
ethane	CH <sub>3</sub>	C <sub>2</sub> H <sub>6</sub>
butane	C <sub>2</sub> H <sub>5</sub>	C <sub>4</sub> H <sub>10</sub>
hexane	C <sub>3</sub> H <sub>7</sub>	C <sub>6</sub> H <sub>14</sub>
ethene	CH <sub>2</sub>	C <sub>2</sub> H <sub>4</sub>
butene	CH <sub>2</sub>	C <sub>4</sub> H <sub>8</sub>
hexene	CH <sub>2</sub>	C <sub>6</sub> H <sub>12</sub>

# 4.7 CALCULATING CHEMICAL FORMULAS

#### **PRACTICE**

(Page 188)

### **Understanding Concepts**

- 1. Empirical formulas can be determined from mass percent information.
- 2. Molecular formulas can be determined if one also has molar mass information.
- 3. Assume a 100 g sample, for convenience.

$$m_{\rm K^+} = 28.9 \text{ g}$$
  $M_{\rm K^+} = 39.10 \text{ g/mol}$   
 $m_{\rm S} = 23.7 \text{ g}$   $M_{\rm S} = 32.06 \text{ g/mol}$   
 $m_{\rm O} = 47.4 \text{ g}$   $M_{\rm O} = 16.00 \text{ g/mol}$   
 $n_{\rm K^+} = 28.9 \text{ g/} \times \frac{1 \text{ mol}}{39.10 \text{ g/}}$   
 $n_{\rm K^+} = 0.739 \text{ mol}$
