# 1.Indicate if each statement is true or false. (10 marks)

T for True or F for False	Statement
	Each element in a <b>group</b> on the periodic table has the same number of electrons in its outer shell.
	The <b>period</b> an element is in on the periodic table tells how many shells of electrons the element has.
	An atom in group thirteen will have three valence electrons.
	Metals are found on the left hand side of the periodic table.
	In a decomposition reaction, one reactant becomes two products.
	Na + Cl₂ → 2NaCl is a balanced chemical equation.
	Metal ions are positively charged and sometimes negatively charged.
	Reactive elements can become more unstable when they form compounds.
	lonic compounds are named with the non-metal ion first, then the metal ion ending in 'ide'.
	Covalent compounds are named using roman numerals.
